New Belkasoft tool saves security specialists time

Belkasoft announces a new generation of their flagship tool

Belkasoft, a computer forensics software vendor, announces today the release of a new generation of their flagship tool called Belkasoft Evidence Center. The tool is aimed at helping security specialists collect digital evidence from a computer, such as Internet chats, web-surfing history and email communications.

Belkasoft has reworked the older products, gathered many customers' wishes and introduced a lot of enhancements to this new release. The distinguishing features of the product include case management, an ability to store evidence information in a database, support for multiple-monitors, hash values calculation for evidence data, support for huge cases such as multiple Outlook mailbox case, etc. Unlike the previous generation Belkasoft Forensic Studio, which is a bundle of three separate products (Instant Messenger Analyzer tool, Browser Analyzer tool and Mail Analyzer tool), the new product has all the three parts in one interface, enabling a user to perform a variety of operations against all available case information in a uniform way.

Belkasoft Evidence Center, main screen

"We are proud to have completed this release which is really a condensation of our customers' requests," says Yuri Gubanov, the owner and CEO of Belkasoft. "The new tool is really handy, which is proved by the first feedback of our main customers from various police departments all over the world."

Andreas D., a forensic professional from Germany, who has helped Belkasoft with the Beta testing of the product, says: "It works like a charm! The software is more than straightforward!"

Wolfgang L., a forensic investigator from the German police, says: "Your product is very versatile and is a good additional tool. Other tools are not that good in making a "readable" report for the court!"

The Enterprise version of the Evidence Center tool makes it possible for multiple users to work simultaneously with the same case using shared SQL Server database. The Enterprise version is intended for major security or police departments.

Belkasoft Evidence Center is available on Belkasoft site at <http://belkasoft.com>.

About Belkasoft

Belkasoft is an independent software developer founded in 2002. We specialize in computer forensics and system software for the Windows platforms. With our slogan "Forensics made easier", we are trying to help IT forensic investigators by creating the tools with out-of-the-box solutions which do not require deep specific knowledge to operate.

Along with the flagship [Belkasoft Forensic IM Analyzer](#), we are also known for our [Belkasoft Forensic Studio](#), [Belkasoft Forensic Carver](#), [Belkasoft Browser Analyzer](#), and some other software used in forensic investigations, law enforcement, intelligence, corporate security and parental control.

Our solutions, [chosen by the FBI](#), the US Secret Service, the police of Germany, Norway, Australia, New Zealand, etc, PricewaterhouseCoopers, Ernst & Young and others, greatly increase the efficiency of collecting digital evidence from a computer.
